magmodules

CLI Commando's

Reloadify for Magento 2

Command line tools for managing the Reloadify integration. These commands are useful for initial setup and troubleshooting.

Available Commands

Command	Description
`reloadify:integration`	Create or update the integration token
`reloadify:selftest`	Run diagnostic tests on the module

reloadify:integration

Creates the Magento integration and generates an access token for Reloadify.

```
bin/magento reloadify:integration
```

Output:

```
Integration token: abc123xyz...
```

Copy this token to your Reloadify dashboard to authenticate the connection.

Options

Option	Description
`--update=1`	Regenerate the token (invalidates old token)

Regenerating a Token

If you need a new token (security rotation, compromised token):

```
bin/magento reloadify:integration --update=1
```

Important: After regenerating, immediately update the token in Reloadify. The old token stops working immediately.

When to Use

- **Initial setup** - Generate token after installing the module
- **Token rotation** - Periodically regenerate for security
- **After restore** - If database was restored without the integration

reloadify:selftest

Runs diagnostic checks to verify the module is configured correctly.

```
bin/magento reloadify:selftest
```

Output:

```
Extension Status: success - Enabled
Extension Version: success - 1.15.0
Magento Version: success - 2.4.6
PHP Version: success - 8.2.0
```

What It Tests

Test	Checks
Extension Status	Module is enabled in configuration
Extension Version	Current installed version
Magento Version	Magento version compatibility
PHP Version	PHP version compatibility

Interpreting Results

- **success** - Test passed, no action needed
- **failed** - Issue detected, check the message for details

When to Use

- **After installation** - Verify everything is set up correctly
- **Troubleshooting** - First step when something isn't working
- **After upgrades** - Confirm compatibility after Magento or module updates
